

There is a large body of biological research studies demonstrating bad effects from radio frequency radiation (RF, RFR). RF is essentially anything that is wireless and includes cell phones, cell towers, utility smart meters, home wireless routers, cordless phones, Wi-Fi hot spots, baby monitors, and more.

The wireless industry has chosen to ignore these studies - because the ill effects are not immediate - though there are some people who do experience immediate adverse symptoms when exposed to every-day levels of RF. Symptoms include nausea, headaches, disorientation, body aches, etc. Children are particularly susceptible. There should be no RF in elementary schools.

The Federal Communications Commission (FCC) has shirked its responsibility. They have jurisdiction over RF. A recent Harvard research report labeled the FCC as a "captured agency" - captured by the industry it supposedly regulates.

BUT NOW...

We have important new evidence - a two-year, \$25M study from the National Toxicology Program (NTP) of the National Institute of Health (NIH) that demonstrated the link between RF exposure and cancer in laboratory animals!

IN SPITE OF THIS...

The FCC wants to significantly raise our collective exposure by deploying 5G wireless cell phone networks, a massive increase in the number of RF emitting antennae, and connecting all electronic devices via Wi-Fi wireless (i.e, IoT, Internet of Things).

As Harvard said, the FCC is a "captured agency" - and they must be stopped.

And now we have the new NIH study. How does one responsibly ignore that?

Say "NO" to more RF.
